The Promise, Reimagined

The smart home kept part of its promise — and hid the rest in fine print. It only worked when the cloud was up, only inside one brand's walled garden, and it stopped at your own front door. IPhouse tears up the fine print.

In Your Hand

One app is the entire world of your home: lighting, scenes, climate, cameras, door locks, offline voice, solar, battery, and EV charging.

Reaching it from anywhere is effortless — no VPN, no port forwarding, no static IP. Encrypted peer-to-peer connects your phone straight to your gateway in seconds.

Always On

Unplug the internet and everything keeps running. Automations fire, the offline voice assistant answers, cameras keep their AI eyes open, and KNX and Modbus devices never miss a beat — because the intelligence lives in the gateway, not the cloud.

From Home to City

The same platform scales from a living room to a hotel, a hospital, a factory, and a whole city — with one dashboard showing power consumption, live solar production, building status, gateway health, alarms, and AI analytics at a glance.

The Green House

Built green to the wiring: a DC bus powered by solar and battery that always knows its remaining energy, switches to grid backup automatically, and reverses on command so the grid is main and the battery is held in reserve.

Open, Secure, Available Now

Open — KNX, Modbus, MQTT, ONVIF, RTSP, REST, Matter ready. Secure — zero trust, end-to-end encryption, signed firmware, full audit trails. And real, today: over 50,000 devices across more than 5,000 gateways at 99.99% availability.
